

From Image to Information.

VISTA GmbH as an **innovative remote sensing company** has been working on translating state-of-the-art scientific methods into **operational services** for over 20 years.

The fields of **services and applications** tackle agricultural, hydrological and environmental issues within a **global setting**. This is achieved by combining **optical and radar satellite images** of different resolutions. **Plant growth modelling** (using the model PROMET) is another one of VISTA's core activities.

With **TalkingFields**, a joint development by FarmFacts GmbH, LMU Munich and VISTA GmbH, a range of **tailor-made products** for agricultural applications has been available for several years.
